Layered Securation

- A Novel Concept for Modern Security Architecture
- Praful Awasarmol
- Mulund College of Commerce (Autonomous)
- 12 May 2025

Introduction

- • Rise in cybersecurity threats
- • Need for flexible & conceptual security models
- • Introducing 'Layered Securation'

Definition

- Layered Securation:
- "An abstract, multi-layered model of security inspired by logical, scientific, and philosophical dualities."

- Focuses on reverse logic and parallel abstraction.

Algorithm & Example

- • Encryption = Differentiation
- • Decryption = Integration
- • Example Flow:
- - Input Data → Encrypt (Diff) → Secure Layer
- - Decrypt (Integration) → Output Data

Types of Layered Securation

1. Mathematical Layer (Diff/Int)
2. Series Layer (Arithmetic / Reverse)
3. Trigonometric Layer (Sin / Inverse Sin)
4. Data Science Layer (Induction / Deduction)
5. Graphical Layer (Tree/Graph Reversal)
6. Life Layer (Good/Bad, Fast/Slow etc.)

Market Relevance

- Cost-effective model
- High customization
- Evolves with AI & large datasets
- Potential use in multiple industries

Future Scope

- • Application in AI, IoT, and cyber-psychology
- • Secure decision-making systems
- • Foundation for next-gen cryptography

Conclusion

- • Innovation in abstract security logic
- • Combines logic, emotion, science, duality
- • A developing research field with vast possibilities
